Honey is a valuable product, often used in medicine and as a dietary ingredient. All of its sweetness disappears when it reaches the laboratory as a matrix for LC-MS/MS analysis, due to the great diversity of components content (over 180) between each, which undobtly affects its properties.

Data were acquired on QTRAP 5500+ (SCIEX) mass spectrometer coupled with ExionAC LC (SCIEX) and processed with SciexOS 2.2 software. The LC-MS/MS analysis was performed in positive ionization sMRM mode during reversed phase 12-min separation on Fortis H2O C18 chromatographic column. Mobile phases consisted of water, acetonitrile and formic acid additive.

Present results concern the determination of 57 antibiotics residues belonging to different groups, such as Sulfonamides (16) Fluorochinones (8) Macrolides (6) Tetracyclines (6) Cefalosporines (5) Chinolines (2) Aminocyclitols (2) Diterpens and Diaminpyrimidines in a single unified sample preparation procedure followed by LC-MS/MS analysis.
